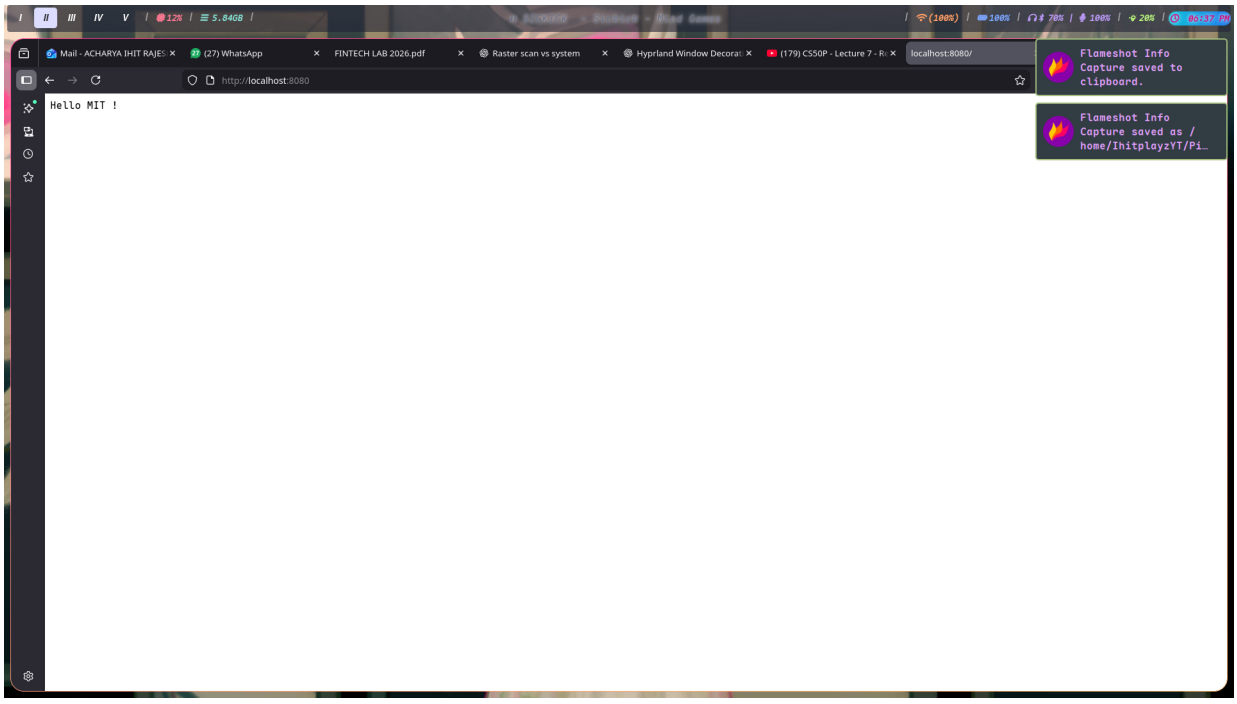
INTRODUCTION TO FINTECH

Q1 Setup the spring boot application and print the hello world message

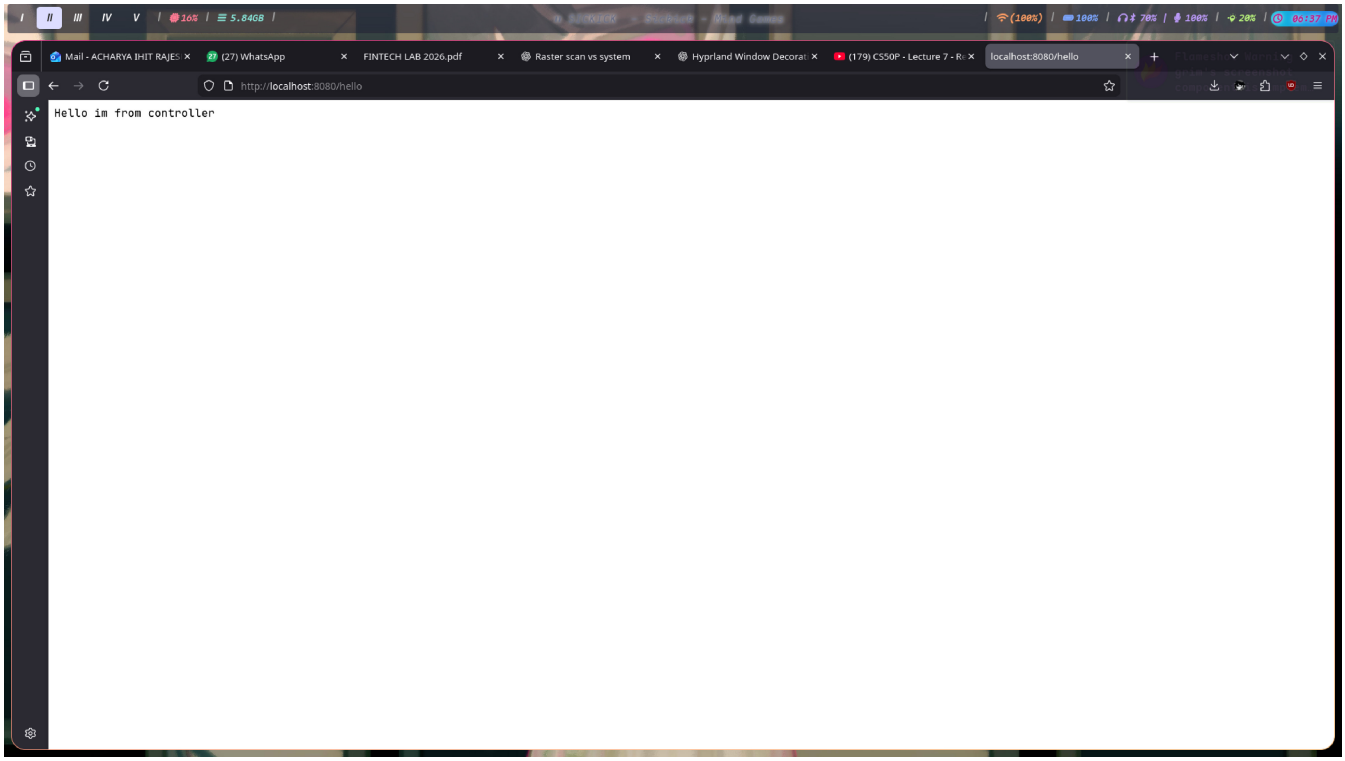
- Used start.spring.io to make a readymade spring project.
- Unzip and open the project as a new maven project and choose the pom.xml.
- Navigate to the src/main/java/com/example/myproject and create a new class file[I named it as myproject.java].
- write a simple class and map a function to an endpoint using the @GetMapping("/") annotation and make the function return a string.
- Run the application.

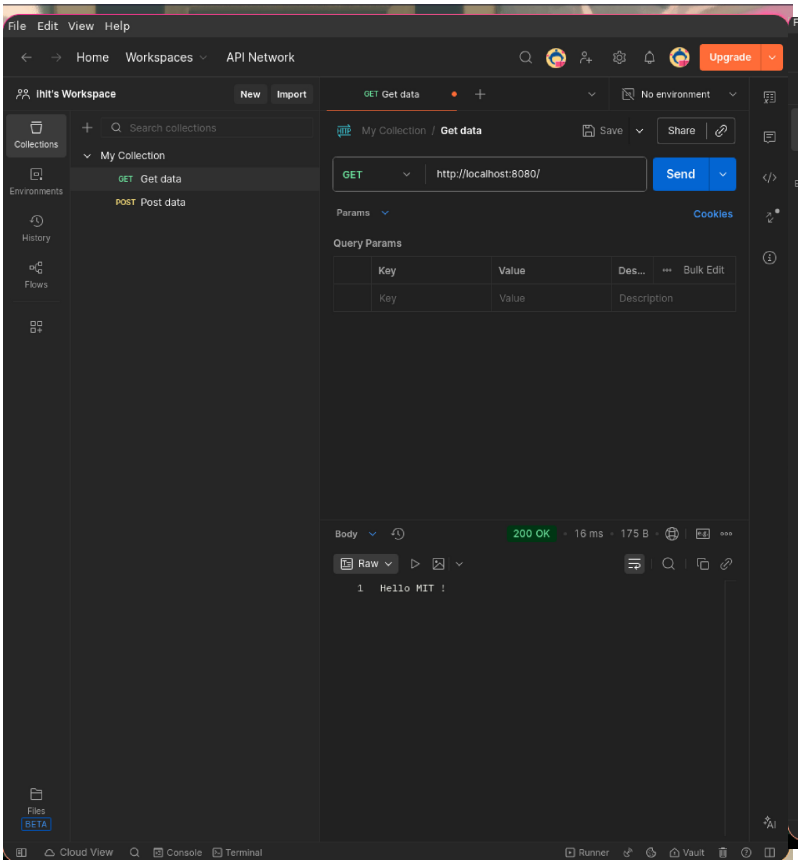


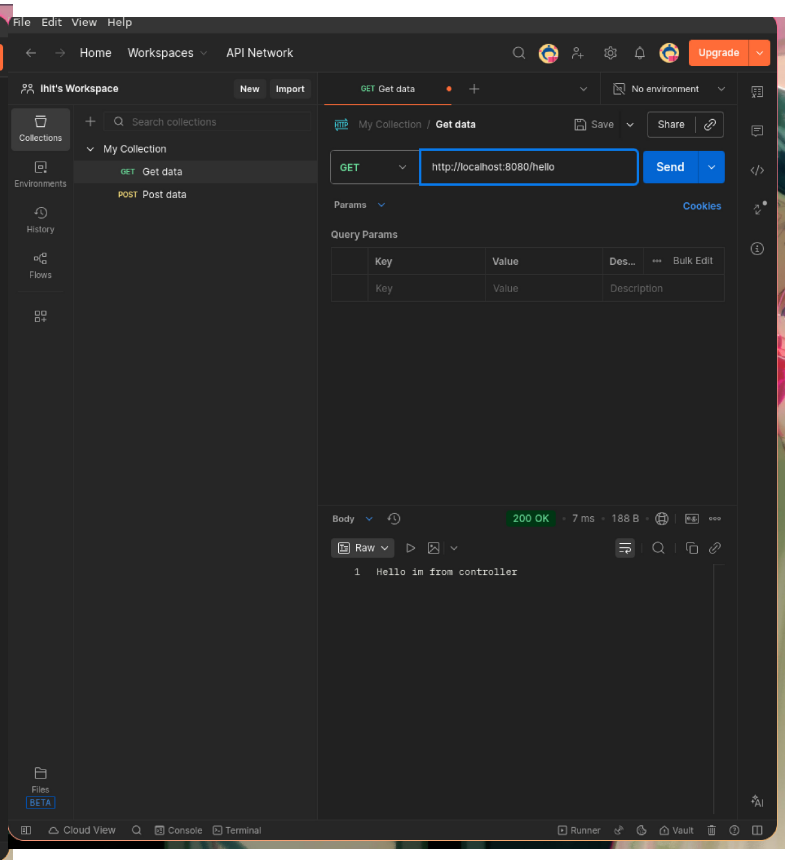
Q2 Setup the spring boot application with hello world message in separate package named controller

- Used start.spring.io to make a readymade spring project.
- Unzip and open the project as a new maven project and choose the pom.xml.
- Navigate to the src/main/java/com/example/myproject and create a new package and in the package make a class file.[I used package com.example.myproject.controller]
- write a simple class and map a function to an endpoint using the @GetMapping("/hello") annotation and make the function return a string.

- Run the application at localhost:8080/hello as endpoint



Q3 Test the above application in POSTMAN




Open postman select the request as GET request and paste the localhost link.
