Bulk customer generation

Customer generation using a raw query and random

The screenshot displays the Postman interface with a POST request to `http://localhost:8080/api/detail/generate/6` that has been successfully executed, returning a 200 status code. The 'Collection' panel on the left is empty. The 'Headers' tab is selected, showing 'No headers'. The 'Body' tab shows the message 'Generated 6 records'. A second Postman window is overlaid, showing a POST request to `http://localhost:8080/api/detail/raw` with a raw SQL query in the body. The query is: `INSERT INTO customer_detail (customer_gender, customer_type, customer_dob, customer_lang, customer_status, customer_country, crud_flag) VALUES ('M','VIP','2000-01-01','EN','ACTIVE','IN','C')`. The response is a JSON object: `{ "rowsAffected": 1 }`.

POST `http://localhost:8080/api/detail/generate/6` 200

The screenshot displays the Postman application interface. At the top, the workspace is named 'Iht's Workspace'. The main area is configured for a **POST** request to the URL `http://localhost:8080/apl/detail/upload`. The request body is set to **form-data**. Below the configuration, a table lists the body items:

Key	Value	Description
file	detail.csv	
Key	Value	Description

The bottom section shows the **Test Results** for the request, which returned a **200 OK** status with a response time of 30 ms and a body size of 289 B. The response body is displayed in the **Raw** tab as a JSON object:

```
1 Bulk customers inserted successfully
```
